

AT&T  
Internet  
vpn  
gateway

fast, easy, secure and  
**reliable**  
communications

with **remote**  
employees.

Global Network Services

## Key Benefits

- Access corporate applications securely from the Internet
- Access from Cable or Digital Subscriber Line (DSL) Internet connections
- Access secure information through Internet Protocol Security (IPSec) session and 3DES encryption
- Simultaneously access Internet and intranet
- Firewall facilities monitor and verify IP packets received
- Support for all users connecting to an AT&T Global Network Services local dial point of presence
- Compatible for variable speeds of broadband facilities
- Compatible for either NIC or non-NIC registered addresses

Use your existing Internet, Cable or DSL connection to enable quick and convenient access to essential information on your intranet.

The same User ID and Dialer Software that are used for AT&T Internet Virtual Private Network (Internet VPN) gateway may also be used for AT&T Remote Access Services. This allows you to get on-line when you are away from your broadband Internet connection. Our consistent interface reduces the training, support and end-user configuration required when shifting between broadband and dial access. We work with you to create a networking portfolio that will ensure access any time, anywhere, any way your business grows.

Our expert personnel will build a solution that is able to grow with your company.

The AT&T Internet VPN gateway is supported by a global network engineered to provide world-class service and reliable transport of your business information. Our global capabilities allow for seamless, reliable delivery with a single point of contact. We will help you to confidently manage the complexity and convergence of today's technology. Trust AT&T to keep you connected with your remote or travelling workforce and business partners.

## Our security features guard your data in transit and prevent unauthorized access to your information assets.

The software provided with the AT&T Internet VPN gateway establishes an IPSec tunnel. IPSec is a set of protocols defined by the Internet Engineering Task Force (IETF) and provides a framework of open standards for ensuring secure private communications over the Internet. Once the tunnel is established it uses 3DES protocol and your Internet connection to link your workstation with the AT&T Internet VPN gateway so that you can securely communicate with your intranet. Firewall type protection is also included to mask the IPSec tunnel and to prevent unauthorized inbound access to the workstation or your corporate applications.

## Our services are built to leverage your existing investments while looking towards future requirements.

Our Internet VPN gateways are software-controlled. By simply downloading software, instead of physically reconfiguring hardware at hundreds of points of presence around the world, we are able to implement your technology enhancements quickly. This allows us to virtually eliminate the risk of your solution becoming obsolete by deploying rapid updates in anticipation of your future developments.

## Trust us for fast, easy, secure and reliable communications with your remote employees.

Monitored around the clock with the latest in management tools, AT&T Remote Access Services are designed to deliver fully managed and reliable connections through a security-rich computing environment. Our highly advanced infrastructures are designed with your needs in mind and allow rapid deployment of new applications and services with minimal investment and maximum benefit. Trust our breadth of services, next-generation technologies and skilled experts to deliver the dynamic, reliable and flexible networking solutions that enable your business — large or small, local or global — to be successful today.
