AT&T IP Flexible Reach Service on AT&T MIS Service
Cisco Unified Border Element (CUBE)
Customer Configuration Guide for
Media Flow Around with AT&T Certified IP-PBX Solutions
(February 16, 2016, Version 1.0)

Introduction

This Customer Configuration Guide (“CCG”) provides recommended guidelines for configuring the customer-managed Cisco Unified Border Element (CUBE) for Media Flow Around (MFA) operation with AT&T IP Flexible Reach Service on AT&T MIS Service (“AT&T MIS”) as the Underlying Transport Service, specific to the various AT&T Certified IP-PBX Solutions listed below. The CUBE is cascaded behind the Customer Edge Router (CER). This CCG is to be used in conjunction with the appropriate IP-PBX/SBC CCG which cover the additional configurations required for use with this service including, but not limited to, configuration of the IP PBX and SBC. See the References section below for links to the appropriate documents based on the solution being used.

MFA causes media to flow directly between customer end devices such as phones and the AT&T IP Border Element (IPBE) rather than being processed through the CUBE. There are several advantages to MFA including media flow directly to remote IP Phone sites (avoiding hub sites) and increased concurrent call capacity on the CUBE. Several prerequisites must be met to enable MFA. Your account team can help determine if this feature is available in your environment.

The following solutions are currently supported with a cascaded CUBE and are covered in this guide:

- Cisco Unified Communications Manager with cascaded Cisco CER / ASR CUBE 1.4
- Cisco Unified Communications Manager with cascaded ISR G2 CER / CUBE 10.0

Please ensure your system set-up is consistent with the recommended specifications provided in this document. AT&T reserves the right to modify or update its guidelines at any time without notice, so please check the following link to be sure you have the latest version of this document (<http://www.corp.att.com/bvoip/ipflex/training/> (login: att, password: attvoip)).

The document links below are hosted on either a public Cisco website not requiring authentication or an AT&T website requiring the following authentication; login: att, password: attvoip. Each certified solution is listed below with the required documentation to configure the IP-PBX/CUBE.

1.1 Caveats

Note that the caveats described in the following documents also apply to the Media Flow Around (MFA) mode of operation. In addition when the call forward unconditional (call forward all) feature of Cisco Unified Communications Manager is used and the forward number is a toll free number that uses a network prompter (i.e., a valid response from the calling party is required before the toll free number provides connect) the call fails with no audio. Typically this type of toll free number is used by large scale call handlers such as reservation systems and customer support lines. There is no issue with call forward unconditional to toll free numbers that don't employ a network prompter or any other destination.

2 Overview

AT&T IP Flexible Reach Service over AT&T MIS as the Underlying Transport Service is an AT&T Business Voice over IP (BVoIP) Service.

This document should be used solely as a general configuration guideline. The Customer is solely responsible for determining the appropriate configuration for their specific environment; AT&T provides resources to assist with that configuration. Please contact your AT&T technical support representative for assistance if needed.

Configuration examples in this guide are provided for informational purposes only. The example configurations may be mapped to a variety of vendor implementations, check with your AT&T technical support representative if you have any questions.

Note: The configuration examples provided in this document are based upon Cisco IOS features, however, the features are NOT described in their entirety; and may vary across

hardware platforms and versions of IOS. Please refer to the appropriate Cisco documentation relative to your IOS features.

3 Special Considerations

- The following TCP/IP ports must not be blocked by firewall or access lists:
 - AT&T IP Border Element signaling and media addresses.
 - SIP signaling traffic (UDP port 5060).
 - RTP/RTCP traffic (UDP port range 16384-32767).
- The configuration information in this CCG assumes a single primary CER. Any alternate routing configurations or remote branch connectivity to other sites, within the same or other AT&T MIS, requires proper configuration of the signaling and media paths. Routing configurations in all customer routers need to be set up to assure that the routing in the primary CER is not affected.

4 Cisco Unified Border Element Configurations for various IP-PBX Solutions

This section will assist in properly configuring Media Flow Around (MFA) on the Cisco Unified Border Element (CUBE) to insure interoperability with AT&T Certified IP-PBX solutions for use on AT&T IP Flexible Reach Service on AT&T MIS transport. Please review the section below that is applicable to your environment.

Important Note: The IP-PBX solutions below make reference to IP Border Element (IPBE) IP Addresses, Signaling IP Address, and Media IP Address which are provided to the Customer

AT&T IP Flexible Reach Service on AT&T MIS Service
Cisco Unified Border Element (CUBE)
Customer Configuration Guide for
Media Flow Around with AT&T Certified IP-PBX Solutions
(February 16, 2016, Version 1.0)

prior to the scheduled Pre-test date in a letter AT&T will send titled Customer Router Configuration Shipping/Confirmation. The Signaling IP Address and the Media IP Address can be Customer supplied or AT&T provided.

Throughout this document, AT&T provided IP Address is synonymous with IP Flexible Reach IP Address.

4.1 **Cisco Unified Communications Manager with Cisco ISR G2 CER and cascaded ISR G2 CUBE 10.0 or with Cisco CER and cascaded ASR CUBE 1.4**

This Cisco Unified Communications Manager (CUCM) solution works in conjunction with a CUBE that is separate from a Cisco CER (referred to as cascaded CUBE). This section covers the CUBE and CUCM specific commands. Please see the appropriate CCGs for CUCM and CER specific configurations.

Note:

- The cascaded CUBE with Media Flow Around (MFA) only supports Customer Managed Sites running IOS **15.4(3)M1 (CUBE 10.0) on the ISR G2** or IOS **15.3(3)S1 (CUBE 1.4) on the ASR 1001 or ASR 1002**.
- Network Address Translation (NAT) of the Signaling Address is not an option for the cascaded CUBE solution with MFA.

4.1.1 **Changes to Standard Solution (binding the signaling only to a loopback interface) to Support Media Flow Around**

Step 1: Configure media flow around

Configure the CUBE to support MFA.

```
voice service voip  
media flow-around
```

Step 2: Remove media binding

Remove the media binding(s) if present. The media binding may be found in the global voice service voip -> sip section of the configuration and/or in the dial-peers. Both locations must be checked. For simplicity, only one dial-peer is shown in the example below.

```
voice service voip  
sip
```
